

For the big project, you'll demonstrate your understanding and skills by building a Mobile Progressive Web App that meets these requirements.

1. Includes at least 3 screens;
2. UI built using Material Components for the Web;
3. Retrieves data from at least two different endpoints;
4. Includes a visualization (map, chart, or ?);
5. Stores and retrieves data from the IndexedDB;
6. Utilizes some hardware feature (sensor, camera, microphone, etc);
7. Includes a Service Worker;
8. Functions offline (due to cached assets);
9. Installs on device (due to Web App Manifest)

I won't be evaluating your app concept; you can build your own app that duplicates the functioning of other apps.

Your project should be accessible via GitHub pages at a repo named **it202-big-project**

Your repo **must** have multiple commits that show your development over time.
